SEA ICE TRACE (sled hauling line)

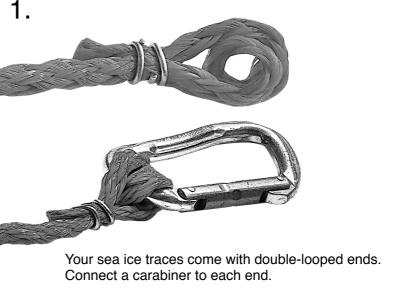

INSTRUCTIONS

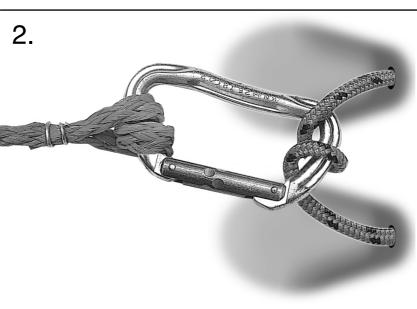

Made from high-strength floating rope, Icetrek Sea Ice Traces are suitable for any aqueous environment. These traces are cut short to allow close tracking of your sled through ice rubble.

www.icetrek.com

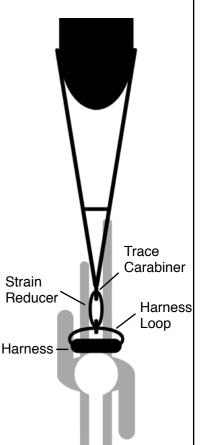

Place a double bend in the tow loops on your sled and attach the carabiners/trace.

3.

Ideally your harness should have a rope loop running from one side of the waist belt to the other. Clipping the trace carabiner into this loop (or via the *Download Strain Reducer*, sold separately) allows the load on your harness to equalise when your sled is not in directional alignment with your body.

Spectra tow loops on both sides of the sled are used to connect your sled trace. Always place a double bend or Larks Head knot in the tow loops when connecting. This reduces friction and increases strength. (A Clove Hitch is not preferable as it is harder to undo).
